

Site Strategy

The uniform alignment results from heliostatism in an earlier development stage, the **BUD** stage, before the appearance of lower heads. The **BUDs** are heliostatic until the end of the **BUD** stage, and finally face East. Their heliostatic motion is a circadian rhythm, synchronized by the sun, which continues if the sun disappears on cloudy days. If a sunflower plant in the **BUD** stage is rotated 180° the **BUD** will be turning away from the sun for a few days. ... []
